

# Automation Engineering Platforms

Building in process and tooling efficiencies

# Agenda

- About Me
- About Us
- Why and the 'Role'
- Problems:
  - ES Rally
  - Component load testing
- Demo
  - Canary failure
  - Canary Success
- The duck-tape
- Conclusion / summary

# Defining our 'Why'

- App's to prod faster
  - Reduced maintenance
  - Reduce risk
  - Manageable + scalable
  - Consistency
  - Accountability
- 

# Role : The tale of 2 sides

## Feature work

- App support (Toolkit)
- Logging/Metrics
  - Prometheus
  - Rules engine
- Service mesh (Istio)
- IAC
  - Terraform
  - Helm
- Containers (AKS)

## Framework / solutions

- Component load testing
- PACT
- DaaS
- Chaos engineering (Monkey)
- API automation
- Functional checks
- Event driven automation

# The Challenges

- ES Upgrade
- Load testing

“The challenge of the unknown future is so much more exciting than the stories of the accomplished past.”

- Simon Sinek

# Problem: Elasticsearch Upgrade

- Version upgrade 2.4 -> 5.6
- New indexes
- Document structure changes
- Perf testing was done through the frontend

# Solution: **ES Rally**

- Get relevant indices and ingest these
- Able to run locally and in the build pipeline
- Build and execute relevant queries
- Tool to be containerised
- Results published and viewable in dashboard

# The Baseline and load tests

# Summary

- Good introduction to team culture and process
- Experiments with docker
- Vendor engagement with Elastic
- \* Exp with building/supporting tools for other teams
- 
- Undefined goals and expectations
- No K8s

# Problem 2: Component load testing

- Perf Testing was at the end of the Dev process
- Lack of transparency
- Lack of accountability
- Expensive process

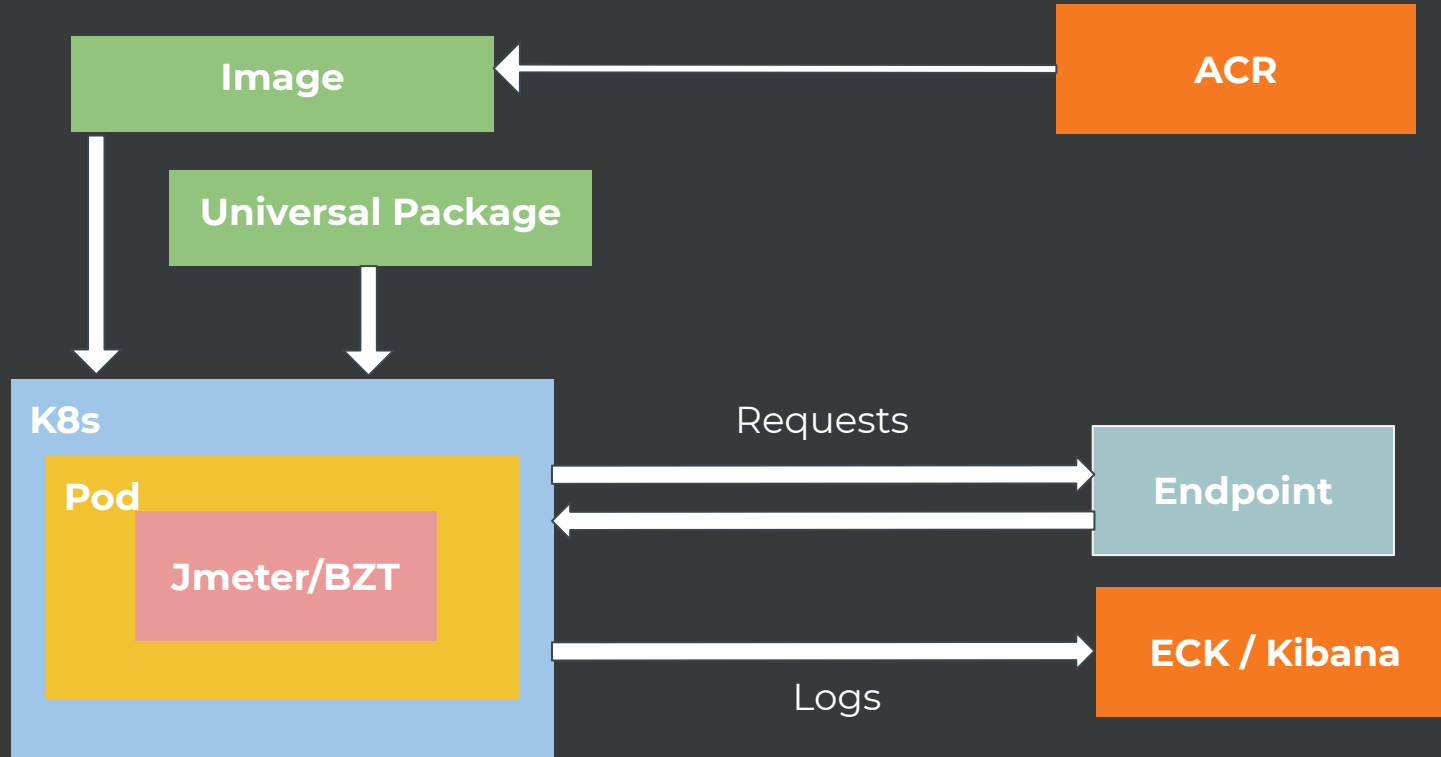

# Component based load test framework

- Run locally and at each CD stage
- Uses **docker** and **K8s**
- Use of **Helm** templates (run as a job)
- Includes reporting , metrics and alerting
- Defined goals and expectations
- Out of the box solution

Control Options

Output Variables

# Helm

- A **package manager** : Homebrew, APT, Chocolatey
- Simplified deployment and testing
- **Yaml** config (chart + templates)
- Release naming+versioning

# Universal packages

A named / versioned collection of files

- Configuration files/scripts and templates (e.g. ARM templates)
- Database snapshots for integration testing
- Machine learning training data and models
- Developer tools and SDKs
- 3D models and textures
- Uses the VSTS / az artifacts CLI

Demo

**START WHERE  
YOU ARE.**

**USE WHAT  
YOU HAVE.**

**DO WHAT YOU CAN.**

**ARTHUR ASHE**

SCRATCH PAPER STUDIO

# Reject Canary

- Deploy the app to UAT and run the load/functional tests
- Poll the webapp and load test pods
- Review the docker entrypoint
- Look at the config.yaml
- Cancel the Canary

# Accept Canary

- Build to UAT
- Trigger a Proceed
- New version gets pushed out
- Canary cleaned up

# Stitching it all together

“Everything is created twice, first in the mind and then in reality.”  
— **Robin Sharma**

Fulfilment

# Review

- We defined our 'why' early on
- We built the solutions then applied partial support
- Detailed wiki and readme's helped
- We used tools available and being analysed by the team
- We started with real world issues
- Using a 'core' team for designing and building tools internally has its benefits

# Thankyou
